

# Seven Reasons Modulus Connect Is Superior to Taleo Connect Client

1999

Software as a Service (SaaS)

2007

Integration Platform as a Service (iPaaS)

2013

Modulus Connect (iPaaS)

ORACLE Gold Partner

Nearly every company has embraced the time, money, and resource-saving benefits of Software as a Service (SaaS). However, the data from these different solutions now resides in disconnected silos, primarily on the cloud.

The next wave in business optimization to save time, money, and IT resources is **iPaaS (Integration Platform as a Service)**. HR integration experts Modulus Data have successfully developed and deployed a cloud-based integration platform, **Modulus Connect**, which is proving to be the most flexible, easy to use, and cost-effective iPaaS for HR systems as these systems often require custom data mapping and complex business rules for perfect integration.

**Modulus Connect integrates any software system via API in near-real-time at any volume in the cloud.** It also can use file transfer to integrate programs that don't have an API.

Clients regularly choose next-generation Modulus Connect over older integration methods. In the case of Taleo Connect Client the reasons are particularly clear.

1

## Modulus Connect is an all-in-one solution

With any integration, there are two parts. You have to write scripts to pull data from one application and write scripts to push data to another. Taleo Connect Client only pulls the data from Taleo. Another script solution is needed from the other application. Modulus Connect handles both pull and push.

2

## Integration with Modulus Connect is faster

Instead of needing two development teams or two separate scripts for a Taleo to Oracle HCM Cloud integration (for example), pull and push is integrated by one solution. Thus, integration often takes half the time as using TCC and an additional integration tool or script.

3

## Gain Near-Real-Time Data at any volume

TCC pushes files that need to be pulled by other applications. Many applications crash if they receive files too frequently. As a result, most clients schedule TCC file transfers to occur only one time each day.

Using Modulus Connect's direct connection through API, data transfer occurs in near-real-time without crashing applications. Simply enter something in one system and it is instantly viewable in the other system. Global client case studies have already successfully proven that Modulus Connect can handle any volume of data in near-real-time.

## 4 Integration Platform as a Service costs less using Modulus Connect

Modulus Connect was conceived to create cost savings for clients.

While Modulus Connect can connect any software, connectors are pre-configured for Taleo integrations to many popular HR applications including Oracle HCM Cloud, NetSuite, PeopleSoft, EBS, ADP Workforce Now, and more.

Cost savings come from less billable hours during integration and from not having to use internal IT resources to maintain scripts. Under Modulus Connect's IaaS model, Modulus Data monitors, maintains, and takes whatever steps are necessary to ensure your integration stays up and working.

With TCC, your company needs a qualified software engineer to monitor, maintain, and potentially alter Taleo and other pull application scripts as your business evolves. Or you need to bring in additional resources should something break.

## 5 Enjoy unlimited flexibility

Modulus Connect can handle any integration, but it loves the complex stuff. Modulus Connect's graphical interface easily allows for unlimited business rules and data mapping transformations. It is also bi-directional, so changing values in one application changes values in the other. TCC only pushes data one way and usually involves further complications when dealing with custom fields.

## 6 Instant monitoring

Because TCC only pushes a file, there is no proof the integration is actually working without running an integration report from another application.

Modulus Connect monitors the integration from both applications and instantly generates a success or error message. Further, complex business rules can be written in Modulus Connect that can automatically handle integration errors or send an instant email alert to someone if there is an issue with even just one record. With Modulus Connect's mobile and desktop app, you always have instant insight into your integration status without running a report.

## 7 Modulus Connect was designed specifically to surpass TCC

No one knows the limitations of Taleo Connect Client better than Romain Guay, the architect of Modulus Connect. While at Taleo, Romain was the original designer of the Taleo Connect Client extensions that have been used in nearly every Taleo integration and Taleo data warehouse extraction in the world. In 2013, Modulus Connect was created specifically to go beyond the limitations of TCC and offer clients the future of cloud-based integration today.
